

Introducing: **iZap CS** Keychain Scanner Solution

iPower is excited to announce iZap CS, an extension of our successful iZap automated replenishment system. iZap CS utilizes a small keychain scanner that is approximately the size of a remote car door opener. The simple system has only two functions - scan and transmit, everything else is handled at the server level making remote implementations very easy. iZap CS eliminates potential dial-up problems by transmitting scan data via the Internet. Most importantly, at under \$135 per scanner you can now afford to extend your bin replenishment program to even the smallest accounts.

How it Works:

- User scans barcode labels of items needing to be replenished. PO and reorder quantities have been predefined within iZap.
- Keychain scanner is connected to a PC running the iZap CS client software which immediately downloads the scan data.
- Data is automatically transmitted to iZap's webserver via the Internet. No phone line needed!
- iZap generates orders and acknowledgements per the customer and supplier setup.

Benefits:

- Inexpensive to implement (Scanners under \$135)
- Extremely simple to use
- Internet data transmission (No phone line)
- All of iZap's back-end capabilities are still available.
